More particularly, it relates to new heterocyclic compounds and pharmaceutically acceptable salts thereof which  
10 have inhibitory activities of vacuolar type  $H^+$ -adenosine triphosphatases ( $H^+$ -ATPases), especially osteoclast  $H^+$ -ATPase, and inhibitory activities of bone resorption, and therefore are useful for the prevention and/or the treatment of bone diseases caused by abnormal bone metabolism in human  
15 being or animals as the inhibitors of bone resorption or the inhibitors of bone metastasis.

And further, the present invention relates to processes for the preparation of said compounds, to a pharmaceutical composition comprising the same and to a method for the

## Background Art

Some heterocyclic compounds have been known as described in, for example, J. Chem. Soc. Pak. (1995), 17(4), 232-6; J. Am. Chem. Soc. (1994), 116(24), 11014-19; or Chem. Pharm.  
30 Bull. (1990), 38(10), 2841-6. However, it is not known that said compounds have inhibitory activities of vacuolar type  $H^+$ -ATPases or inhibitory activities of bone resorption.

Heterocyclic compounds having inhibitory activities of  
35 vacuolar type  $H^+$ -ATPases or inhibitory activities of bone

resorption have been known as described in WO 97/14681.

10       The reaction temperature is not critical and the reaction is usually carried out under cooling to heating.

      The compound [I] or its salt can be also prepared by reacting a compound [VI] or its salt with the reagent which introduces a carbonyl or thiocarbonyl group as mentioned  
15       above and then by reacting the obtained compound with a compound [VII] or its salt, or by reacting a compound [VII] or its salt with said reagent and then by reacting the obtained compound with a compound [VI] or its salt. These processes are also included within the scope of this process.

Test 1 (Inhibition of vacuolar type  $H^+$ -ATPase proton  
transport) :

30

Test Method

(a) Preparation of microsomes from mouse peritoneal  
macrophages

35

Seven-week-old male ddY mice were injected

intraperitoneally with 2 ml of 3% thioglycolate medium. After 3-5 days, the mice were decapitated, and the peritoneal macrophages were obtained by peritoneal lavage with 5-6 ml of Hanks' balanced salt solution (HBSS). The cells were washed  
5 twice with cold HBSS. Vesicles were prepared from the cells, homogenized in a Dounce homogenizer (20 strokes) in 10 ml of 250 mM sucrose, 5 mM Tris, 1 mM EGTA, 1 mM KHCO<sub>3</sub> and 1 mM dithiothreitol, pH 7.0, at 4°C. After an initial  
10 centrifugation (1000 x g for 5 minutes), the supernatant was centrifuged 6000 x g for 15 minutes) to remove mitochondria and lysosomes. The supernatant was centrifuged at 42000 x g for 30 minutes, and microsomal pellet was collected and stored at -80°C.

15 (b) Measurement of proton transport

Proton transport was assayed with a dual-wavelength spectrophotometer by monitoring uptake of acridine orange (Reference 540 nm, Measurement 492 nm) [H.C. Blair, J. Cell.  
20 Biol., 102, 1164 (1986)] with aliquot of membrane vesicles suspended in 300 ml of assay buffer containing 150 mM KCl, 10 mM bis-tris-propane, 2 mM MgCl<sub>2</sub>, 10 mM acridine orange, 1 mM valinomycin, 10 mg/ml oligomycin and test compounds (concentration :  $1 \times 10^{-6}$ M), pH 7.0. The reaction was  
25 initiated by addition of 1 mM ATP. Results were expressed as the percent of control.

Test 2 (Bone organ culture) :Test Method

Calvariae from Wistar rats were excised and cultured in  
5 wells of 12-well culture plates containing 2 ml of Dulbecco's  
modified minimum essential medium supplemented with 10% fetal  
bovine serum and  $10^{-8}$ M human parathyroid hormone fragment  
(1-34) [PTH] in the presence of the test compound  
(concentration :  $1 \times 10^{-6}$ M). In control dishes, PTH was not  
10 added. Control and PTH control were exposed to an equivalent  
concentration of the vehicle. Six days later, the  
concentration of calcium ([Ca]) in the medium was measured by  
methylxyleneol blue method and the percentage of inhibition of  
PTH-induced bone resorption was calculated according to

(2) 97% Sulfuric acid (57 ml) was cooled to 5°C, and 3-methyl-8-nitro-4-(4-toluenesulfonamido)quinoline (7.6 g) was added portionwise thereto over a period of 10 minutes in an ice bath. The resulting mixture was stirred at 0°C for 1 hour and at ambient temperature for 1 hour. The reaction mixture was added dropwise to ice (100 g) over a period of 30 minutes with stirring at 5-15°C. To the mixture was added 10N-sodium hydroxide aqueous solution (ca. 220 ml) over a period of 1 hour with stirring at 5-30°C (final pH = 10-12). The mixture was stirred at ambient temperature for 1 hour, and the precipitate was collected in vacuo.
